

How to optimize PStill job processing for Windows generated print files

PStill works fastest with Type 1 ('Outline') fonts in the source as it can use them directly in its result. By default the Windows printer driver emits TrueType fonts in a particular way which requires normalization of the fonts as an extra step.

To optimize conversion speed change the setting of the printer driver in its PS options from

TrueType Font Download Option: Automatic

to

TrueType Font Download Option: Outline

You can modify this setting by opening the respective printer properties, select "Advanced", click on the '+' at PostScript Options.
