PStill Vista compatibility:

PStill can run under MS Vista. However some points needs special attention:

1.   Use a printer queue setup'd for a "HP color laserjet 2550 ps"

2.   Make sure the PStill program directory is writeable when calling PStill for the first time. Usually thats C:\program files\gpstill

      Otherwise the license code could not be entered (it is stored in a file in the program directory) and PStill may be unable to update/access its font files.

      If the 'first time use' message appears on every run just erase the file 'remove.me' in the PSFonts directory inside the PStill program folder.
